Poor Construction Practices Lead to Environmental Contamination

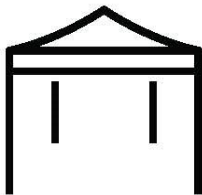

1

Use Vacuums

When cutting or drilling AZEK-TREX or any plastic poly-compound materials, use a vacuum attachment on all saws when practical.

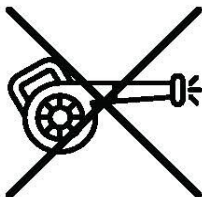

2

Contain Dust

Cut and drill in confined spaces to keep dust to a minimum and ease of cleanup. Never cut or drill without a tarp under power tools. Clean up plastic contaminants before leaving your site.

3

Do Not Blow Away Dust

DO NOT blow your debris into the storm drains. That just washes them into our water systems for contamination that lasts thousands of years.

KEEP CONSTRUCTION PLASTICS AND OTHER CONTAMINANTS OUT OF THE WORKING ENVIRONMENT, OCEANS, BAYS, WETLANDS, SOIL AND AIR

Once created, these materials will stay around for **hundreds - or even thousands - of years;** in which time they can pollute and poison environments and all living creatures within.
